

The decay resistance of six Eucalyptus species after three years exposure

Jackie van der Waals, Ian Simpson and Tripti Singh

Date: August 2019

Publication No: SWP-T085

Executive summary

Durability stakes and stakelets were prepared from six different durable *Eucalyptus* species, (*Eucalyptus bosistoana*., *Eucalyptus quadrangulata*., *Eucalyptus pilularis*, *Eucalyptus sphaerocarpa*., *Eucalyptus globoidea*., *Eucalyptus muelleriana*). For each species, timber had been selected from four different trees with samples taken from both inner and outer heartwoods.

Control stake and stakelet samples from *Pinus radiata* sapwood, *Fagus sylvatica* (European beech), and H3.2 and H4 CCA treated *Pinus radiata* were also included in the test.

The stakes were exposed outdoors at Scion's Whakarewarewa Graveyard, and the stakelets were installed in the Scion's Accelerated Decay House (with a temperature of 27°C and a relative humidity of 85%).

Stakes and stakelets were prepared from the six different *Eucalyptus* species which had been selected to have high natural durability.

Summary of the stakes: After three years exposure,

- For *Eucalyptus bosistoana*, one stake has deepening decay and the remaining 30 minor, but established or well established decay.
- *Eucalyptus quadrangulate*, two failures and remaining 33 have minor, but established to severe decay.
- *Eucalyptus pilularis*, one failure and remaining 41 have minor, but established to deepening decay.
- *Eucalyptus sphaerocarpa*, one stake has minor decay and 49 have minor, but established to deepening decay.
- *Eucalyptus globoidea*, two failures and remaining 58 have minor, but established to deepening decay.
- *Eucalyptus muelleriana*, 57 stakes have well established to deepening decay.
- The differences in inner and outer heartwood between trees of the same species is minimal, except for trees where there has been stake failures.

For the controls:

- All the untreated *Pinus radiata* stakes have failed giving the group an average life of 2.1 years.
- Two *Fagus sylvatica* beech control stakes remain with ratings of 6 (extensive and deepening decay).
- In comparison, the H3.2 CCA treated stakes are rated 10 or 9 (sound to minor decay) and the H4 treated stakes 10 and 8 (sound to minor but established decay).

Summary of stakelets: After 35 months exposure,

- For *Eucalyptus bosistoana*, 20 failures and remaining 20 have deepening or severe decay.
- *Eucalyptus quadrangulate*, 35 failures and remaining 5 have deep and severe decay.
- *Eucalyptus pilularis*, 30 failures and remaining 10 have deep and severe decay.
- *Eucalyptus sphaerocarpa*, 19 failures and remaining 21 have deepening or severe decay.
- *Eucalyptus globoidea*, 22 failures and remaining 22 have deepening or severe decay.
- *Eucalyptus muelleriana*, 39 failures and the remaining stakelet has deep and severe decay.

Across the six *Eucalyptus* species, a total of 165 stakelets have failed due to soft rot. All remaining samples have a rating of 6 or 4 (extensive established and deepening decay to deep and severe decay). Stakelets from six individual trees have failed giving them a group average life between one year 5 months to one year 9 months.

For most trees the outer heartwood is performing slightly better than the inner heartwood when comparing the Indexes of Condition. In individual trees where both inner and outer heartwood stakelets have failed, the average life between the inner and outer heartwood is often the same or the outer heartwood has lasted a few month(s) longer.

- The last untreated radiata pine sapwood stakelets failed at the 17 months assessment giving the group an average life of 8.9 months.
- The untreated beech sapwood stakelets had all failed by 11 months giving the group an average life of 6.5 months.
- No stakelet failures in the H3.2 or H4 CCA treated groups.

The stakelets have considerably lower Indexes of Condition when compared to the in-ground stakes due to their accelerated exposure in the Accelerated Decay House (ADH). The ADH facility is a quicker method to screen samples, but field testing is still required to confirm suitability to outside exposure conditions.

The trials will continue with the stakelets being assessed at three monthly intervals and the next stake inspection will be in June-August 2020. Natural durability stakes are classified according to the Australasian Durability Classification System when the average of a group has been established.

The decay resistance of six Eucalyptus species after three years exposure

Introduction

A stake and stakelet trial were established for durable *Eucalyptus* species selected by the Eucalypt Action Group of Farm Forestry New Zealand. Untreated and CCA treated radiata pine, and untreated European beech were included in the trials for comparative purposes. The stake trial was established in the Whakarewarerwa test area on the Scion campus in June 2016 and the stakelet trial was established in July 2016.

The *Eucalyptus* species included in the test were:

- *Eucalyptus bosistoana*.
- *Eucalyptus quadrangulata*.
- *Eucalyptus pilularis*.
- *Eucalyptus sphaerocarpa*.
- *Eucalyptus globoidea*.
- *Eucalyptus muelleriana*.

Materials and methods

Materials and Sample Preparation

The test method used in this study is based on the protocols for assessment of wood preservatives produced by the Australasian Wood Preservation Committee (AWPC; 2015), and ASTM standard test methods (ASTM 2006).

Timber approximately 25 x 25 mm, of differing lengths, and from six different *Eucalypt* species was supplied by Dean Satchell of the Farm Forestry Group to produce stakes and stakelets for durability testing (Figure 1). Timber had been sawn from four different trees for each species and the supplier informed Scion that the trees were 15 years old and grown in Northland. The lengths of timber had been marked with the tree number and whether the timber was from inner or outer heartwood. Some lengths of timber were marked as inner\outer or mixed. Table 1 shows the number of boards supplied for each tree whether the boards contained inner or outer heartwood. Scion relied on supplier for tree age and origin information.

On arrival at Scion, the strips were air dried in a heated laboratory for five weeks. At the time of installation, the samples were dry.

Ten stakes were cut for each tree, five from the inner heartwood and five from outer heartwood. Some of the trees did not have 5 inner and 5 outer heartwood samples. In this case extra stakes were cut to give a total of ten stakes for each tree.

Stakes were machined from each length as shown in Table 1 to 20 x 20 x 500 mm. Some stakes were slightly undersized leaving a rough sawn surface. It was observed that the stakes from tree 4 (*E. bosistoana*) appeared darker in colour than stakes cut from the other three trees of the same species.

Table 1: Timber supplied to prepare stakes

Eucalyptus species	Tree number	Log number	Number of lengths supplied I = Inner heartwood, O = Outer heartwood M = Mid heartwood
<i>E. bosistoana</i>	1	1	1-I 4-O 1I/O Quite a few short pieces
<i>E. bosistoana</i>	2	1	2-I 3-O

<i>E. muelleriana</i>	23	1	7-I 8-O 5-M 1 short
<i>E. muelleriana</i>	24	1	8-I 8-O

Untreated radiata pine and European beech (*Fagus sylvatica*) stakes were also included in the trial for comparison purposes. The radiata pine and European beech stakes were taken from previously machined stock held at Scion. Stakes were also cut from CCA treated radiata pine treated to H3.2 and H4 obtained from a local retailer. CCA boards were selected as sapwood, however there may have been some heartwood but the % heartwood was not checked or recorded.

Each stake was tagged with a unique number and randomly allocated a plot position in the Whakarewarewa graveyard, as shown in Appendix 1. Notes were made about each stake, including stakes that were undersized or contained knots and kino.

Stakelets (10 x 5 x 160 mm) were machined from each of the Eucalyptus trees and also from radiata pine sapwood, European beech heartwood and CCA treated radiata pine. They were installed in the prepared soil bed in the Accelerated Decay House (with a controlled temperature of 27°C and a relative humidity of 85%). Before installation into the soil bed, all the stakelets were soaked in water for approximately 30 minutes. Samples are labelled with a unique number and installed randomly in the soil bed at least 60 mm apart. Each specimen is buried to half its' length in the soil. The soil beds are refreshed at the three monthly inspection times.

Installation

The stakes were installed in the Scion outdoor test area in Rotorua on 24 June 2016. The European beech and treated radiata pine stakes were installed on 23 August 2016.

The stakelets were installed in the Accelerated Decay House on 5 July 2016.

Assessment methods

The stakes are assessed yearly, this report covers the third inspection and the stakelets at three monthly intervals, using a rating system based on ASTM D-1578 as shown in Appendix I. The last stakelet assessment included in this report was in June after 35 months exposure.

Results and discussion

Assessment results

Table 2 contains a summary of the condition of the stakes after 3 years. Individual ratings are listed in Appendix 2 and 3.

Table 2: Comparison of Index of Condition of stakes and stakelets

Group no.	Tree	Species	Index of Condition ¹	
			Stakes, 3 years exposure	Stakelets, 35 months exposure
1	1	<i>E. bosistoana</i>	7.3	1.6 (6) ²
2	2	<i>E. bosistoana</i>	7.2	3.4 (4)
3	3	<i>E. bosistoana</i>	7.3	4.0 (2)

21	21	<i>E. muelleriana</i>	6.9	Av. life 1 year 6 months
22	22	<i>E. muelleriana</i>	6.9	Av. life 1 year 9 months
23	23	<i>E. muelleriana</i>	6.9	0.4 (9)
24	24	<i>E. muelleriana</i>	6.9	Av. life 1 year 5 months
25	-	<i>P. radiata</i> sapwood	Av. life 2.1 years	Average life 8.9 months
26	-	<i>F. sylvatica</i> heartwood	1.3 (7)	Average life 6.5 months
27	-	<i>P. radiata</i> H3.2	9.8	7.7
28	-	<i>P. radiata</i> H4	8.9	8.9

¹ Index of Condition is the average decay rating for all of the samples in a group.

² Figures in brackets are number of stakes or stakelets that have failed.

The average Indexes of Condition for the Eucalyptus stakes were between 5.8 and 7.3, compared to 6.9 and 8.0 at the two year inspection. The differences between trees of the same species is minimal, except in groups where there have been stake failures (*E. quadrangulata*, *E. pilularis* and *E. globoidea*). Three Eucalyptus stakes failed at this latest inspection, one *E. pilularis* and two *E. globoidea*. White rot was the main cause of failure. The final untreated radiata pine stake failed, giving the group an average life of 2.1 years. The H3.2 CCA treated stakes are still performing

better than the treated H4 stakes with an Index of Condition of 9.8 vs 8.9. Two untreated European beech stakes remain with extensive and deepening decay.

The degree of decay observed in the stakelets was greater due to the accelerated exposure conditions. *E. sphaerocarpa* has the least stakelet failures (19) out of the six Eucalyptus species tested and *E. muelleriana* the highest with 39 (only one sample remains). Soft rot was the cause of failure. The remaining stakelets are rated 6 or 4 (extensive established and deepening decay or deep and severe decay). In comparison, radiata pine H3.2 treated stakelets had an Index of Condition of 7.7 and H4 treated stakelets 8.9. The untreated radiata pine samples had an average life of 8.9 months and the European beech 6.5 months. Table 3 shows the average Index of Condition of the inner and outer heartwood for each tree.

Table 3: Comparison of index of Condition of inner and outer heartwood, for stakes and stakelets.

Group no.	Tree	Species	Index of Condition ¹			
			Stakes 3 years exposure		Stakelets 35 months exposure	
			Inner heartwood	Outer heartwood	Inner heartwood	Outer heartwood
1	1	<i>E. bosistoana</i>	7.0	7.4	-	2.0 (3)
2	2	<i>E. bosistoana</i>	7.5	7.0	2.4 (3)	4.4 (1)
3	3	<i>E. bosistoana</i>	7.2	7.3	3.6 (1)	4.4 (1)
4	4	<i>E. bosistoana</i>	7.3	7.0	0.8 (4)	0.8 (4)
5	5	<i>E. quadrangulata</i>	6.8	7.3	2.4 (2)	0.8 (4)
6	6	<i>E. quadrangulata</i>	5.3 (1)	6.3	Av. life 1.6 yrs	Av. life 1.6 yrs
7	7	<i>E. quadrangulata</i>	7.0	7.0	Av. life 1.4 yrs	0.8 (4)
8	8	<i>E. quadrangulata</i>	5.0 (1)	7.0	Av. life 1.6 yrs	Av. life 1.8 yrs
9	9	<i>E. pilularis</i>	6.5	7.0	Av. life 1.1 yrs	2.4 (2)

22	22	<i>E. muelleriana</i>	6.8	7.0	Av. life 1.9 yrs	Av. life 2.0 yrs
23	23	<i>E. muelleriana</i>	6.7	7.0	Av. life 1.4 yrs	0.8 (4)
24	24	<i>E. muelleriana</i>	6.9	7.0	Av. life 1.1 yrs	Av. life 1.9 yrs

¹ Index of Condition is the average decay rating for all of the samples in a group.

² Figures in brackets are number of stakes or stakelets that have failed

After three years exposure, there are minimal differences in the Indexes of Condition between the inner or outer heartwood stakes, except where there has been a stake failure (Tree 6 & 8 *E. quadrangulata*, Tree 10 *E. pilularis* and Tree 20 *E. globoidea*).

Overall, more inner heartwood cut stakelets have failed in comparison to outer cut heartwood ones.

The remaining samples show that the majority of the outer heartwood stakelets are performing slightly better. In individual trees where the inner and outer samples have all failed the average life between the inner and outer heartwood is often the same or the outer heartwood has lasted a few month(s) longer.

The assistance of Jamie Agnew in the assessing the stakes is much appreciated.

Appendix 1: Rating system

Rating system used for sample assessment

Each stake was assigned a decay rating based on the following system (Appendix 2). The Index of Condition is the average decay rating of all samples in a group (Table 2 and 3).

DECAY/INSECT DAMAGE

- 10 = No decay or insect damage.
- T = "Trace" discolouration, decay suspected but not positively identified.
- 9 = Minor decay or damage at defects, less than 3% of the cross section.
- 8 = Minor but established decay, 3 - 10% of the cross section.
- 7 = Well established pockets or extensive surface damage, 10 - 30% of the cross section.
- 6 = Extensive established and deepening decay, 30 - 50% of cross section.
- 4 = Deep and severe decay, more than 50% of cross section.
- 0 = Disintegrating, failed.

DURABILITY CLASSES

Natural durability stakes are classified according to the Australasian Durability Classification System when the average life of a group has been established. They are as follows:

		50 mm x 50 mm stakes	20 mm x 20 mm stakes
Class 4	Perishable	5 years or less	2 years or less
Class 3	Moderately durable	5 - 15 years	2 - 6 years
Class 2	Durable	15 - 25 years	6 - 10 years
Class 1	Very durable	25 years or more	10 years or more
